CSE
SCUD ARSENAL

# EDITORAL BOARD

Dear Readers,

Greetings and warm welcome to June 2018 issue Volume9 Issue1 of our Magazine ,"SCUD ARSENAL". The previous semester witnessed various ecstatic moments as Autonomous status is given to our college and our department got NBA Accreditation in the month of march. We are looking forward to commence the forthcoming semester with ecstasy and earnest commitment.

Best Wishes
Editorial Board

# GO

For the language released in 2003 by McCabe and Clark, see Go!(programminglanguage)."GoogleGo" redirects here. For the computer program by Google to play the board game Go, see AlphaGo.Go (often referred to as Golang) is a programming language created at Google in 2009 by Robert Griesemer, Rob Pike, and Ken Thompson. Go is a statically typed compiled language in the tradition of C, with memory safety, garbage collection, structural typing,and CSP-style concurrent programming features added.The compiler, tools and source code are all free and open source.

HISTORY:

The language was announced in November 2009.Version 1.0 was released in March 2012. It is used in some of Google's production systems, as well as by many other companies and open source projects.

**Two major implementations exist:**

Google's Go tool chain, targeting multiple platforms including Linux, BSD, macOS, Plan 9, Windows, and (since 2015) mobile devices. The primary Go compiler has been self-hosting since version 1.5.A second compiler, gccgo, is a GCC frontend.

Go originated as an experiment by Google engineers Robert Griesemer, Rob Pike, and Ken Thompson to design a new programming language that would resolve common criticisms of other languages while maintaining their positive characteristics. The developers envisioned the new language as:

1.Statically typed and scalable to large systems (like Java or C++)

2.Productive and readable, without excessive boilerplate(like dynamic languages such as Ruby or Python.

3.Not requiring integrated development environments, but supporting them well

4.Supporting networking and multiprocessing

**Language design:-**

Go is recognizably in the tradition of C, but makes many changes to improve brevity, simplicity, and safety. The language consists of:

1.A syntax and environment adopting patterns more common in dynamic languages

2.Optional concise variable declaration and initialization through type inference (x := 0 not int x = 0; or var x = 0;).

3.Fast compilation times.

4.Remote package management (go get) and online package documentation.

Distinctive approaches to particular problems:

1.Built-in concurrency primitives: light-weight processes (goroutines), channels, and the select statement.

2.An interface system in place of virtual inheritance, and type embedding instead of non-virtual inheritance.

3.A toolchain that, by default, produces statically linked native binaries without external dependencies.

4.A desire to keep the language specification simple enough to hold in a programmer's head,in part by omitting features which are common in similar languages.

**Redis** is an open-source in-memory database project implementing a distributed, in-memory key-value store with optional durability. Redis supports different kinds of abstract data structures, such as strings, lists, maps, sets, sorted sets, hyperloglogs, bitmaps and spatial indexes. The project is mainly developed by Salvatore Sanfilippo and is currently sponsored by Redis Lab

## HISTORY

The name Redis means REmote DIctionary Server.Salvatore Sanfilippo, the original developer of Redis, was hired by VMware in March, 2010. In May, 2013, Redis was sponsored by

## DATA TYPES:

Redis maps keys to types of values. An important difference between Redis and other structured storage systems is that Redis supports not only strings, but also abstract data types:

- Lists of strings
- Sets of strings (collections of non-repeating unsorted elements)
- Sorted sets of strings (collections of non-repeating elements ordered by a floating-point number called score)
- Hash tables where keys and values are strings
- HyperLogLogs used for approximated set cardinality size estimation.
- Geospatial data through the implementation of the geohash technique since Redis 3.2.

The type of a value determines what operations (called commands) are available for the value itself. Redis supports high-level, atomic, server-side operations like intersection, union, and difference between sets and sorting of lists, sets and sorted sets.

The Redis module ReJSON implements ECMA-404 (the JSON Data Interchange Standard) as a native data type.

## FEATURES:

**Speed:** Redis stores the whole dataset in primary memory that's why it is extremely fast. It loads up to 110,000 SETs/second and 81,000 GETs/second can be retrieved in an entry level Linux box. Redis supports Pipelining of commands and facilitates you to use multiple values in a single command to speed up communication with the client libraries.

**Persistence:** While all the data lives in memory, changes are asynchronously saved on disk using flexible policies based on elapsed time and/or number of updates since last save. Redis supports an append-only file persistence mode. Check more on Persistence, or read the AppendOnlyFileHowto for more information.

**Data Structures:** Redis supports various types of data structures such as strings, hashes, sets, lists, sorted sets with range queries, bitmaps, hyperloglogs and geospatial indexes with radius queries.

**Supported Languages:** Redis supports a lot of languages such as ActionScript, C, C++, C#, Clojure, Common Lisp, D, Dart, Erlang, Go, Haskell, Haxe, Io, Java, JavaScript (Node.js), Julia, Lua, Objective-C, Perl, PHP, Pure Data, Python, R, Racket, Ruby, Rust, Scala, Smalltalk and Tcl.

**Master/Slave Replication:** Redis follows a very simple and fast Master/Slave replication. It takes only one line in the configuration file to set it up, and 21 seconds for a Slave to complete the initial sync of 10 MM key set on an Amazon EC2 instance.

**Sharding:** Redis supports sharding. It is very easy to distribute the dataset across multiple Redis instances, like other key-value store.

# Angular JS

## AngularJS Services

The AngularJS developers at Plego Technologies have been designing and developing web applications since 2002 with experience going back to the mid-1990s.

Our AngularJS Development Company has worked with a number of web technologies over the years and we're always excited about new technologies like AngularJS. We're delighted to work with you to determine if AngularJS is the appropriate choice for your short-term and long-term business needs. Our AngularJS services aim to provide your business requirements with a highly optimized web application which is superior in terms of adaptability, security, and stability.

### Why Use AngularJS?

Maintained by Google, AngularJS is a Model-View- Whatever (MVW) open source JavaScript framework that enables developers to develop single-page applications. As a modern framework, it's powerful and extendable for many purposes and a great tool for developers.

If you require support for an existing AngularJS application, get in touch with us! Our company can help with your product backlog. If you're considering new web application, we can help determine if AngularJS is right framework for your project.

### Scope

AngularJS uses the term "scope" in a manner akin to the fundamentals of computer science.

Scope in computer science describes when in the program a particular binding is valid. The ECMA-262 specification defines scope as: a lexical environment in which a Function object is executed in client-side web scripts; akin to how scope is defined in lambda calculus.As a part of the "MVC" architecture, the scope forms the "Model", and all variables defined in the scope can be accessed by the "View" as well as the "Controller". The scope behaves as a glue and binds the "View" and the "Controller".

In AngularJS, "scope" is a certain kind of object that itself can be in scope or out of scope in any given part of the program, following the usual rules of variable scope in

JavaScript like any other object. When the term "scope" is used below, it refers to the Angular scope object and not the scope of a name binding.

## Development History

AngularJS was originally developed in 2009 by MiškoHevery at Brat Tech LLC as the software behind an online JSON storage service, that would have been priced by the megabyte, for easy-to-make applications for the enterprise. This venture was located at the web domain "GetAngular.com" and had a few subscribers, before the two decided to abandon the business idea and release Angular as an open-source library.

The 1.6 release added many of the concepts of Angular to AngularJS, including the concept of a component-based application architecture. This release among others removed the Sandbox, which many developers believed provided additional security, despite numerous vulnerabilities that had been discovered that bypassed the sandbox. The current (as of February 2018) stable release of AngularJS is 1.6.9.

In January 2018, a schedule was announced for phasing-out AngularJS: after releasing 1.7.0, the active development on AngularJS will continue till June 30, 2018. Afterwards, 1.7 will be supported till June 30, 2021 as long-term support.

Legacy browser support

Versions 1.2 and later of AngularJS do not support Internet Explorer versions 6 or 7.[22] Versions 1.3 and later of AngularJS dropped support for Internet Explorer 8

Angular and AngularDart

Angular 2+ versions are simply called Angular. Angular is an incompatible rewrite of AngularJS. It is a TypeScript-based open-source front-end web application platform. Angular 4 was announced on 13 December 2016, skipping 3 to avoid confusion due to the misalignment of the router package's version which was already distributed as v3.3.0

AngularDart works on Dart, which is an object-oriented, class defined, single inheritance using C# style syntax, that is different from Angular JS (which uses JavaScript) and Angular 2/ Angular 4 (which uses TypeScript). Angular 4 released in March 2017, with the framework's version aligned with the version number of the router it used. Angular 5 was released on November 1, 2017.Key improvements in Angular 5 include support for progressive Web apps, a build optimizer and improvements related to Material Design. Angular 6 release will be pushed back to March or April 2018, with Angular 7 showing up in September/October 2018. Each version is expected to be backward-compatible with the prior release. Google pledged to do twice-a-year upgrades.

# Augmented reality (AR)

Augmented reality (AR) is a direct or indirect live view of a physical, real-world environment whose elements are "augmented" by computer-generated perceptual information, ideally across multiple sensory modalities, including visual, auditory, haptic, somatosensory, and olfactory. The overlaid sensory information can be constructive (i.e. additive to the natural environment) or destructive (i.e. masking of the natural environment) and is spatially registered with the physical world such that it is perceived as an immersive aspect of the real environment. In this way, Augmented reality alters one's current perception of a real world environment, whereas virtual reality replaces the real world environment with a simulated one. Augmented Reality is related to two largely synonymous terms: mixed reality and computer-mediated reality.

The primary value of augmented reality is that it brings components of the digital world into a person's perception of the real world, and does so not as a simple display of data, but through the integration of immersive sensations that are perceived as natural parts of an environment. The first functional AR systems that provided immersive mixed reality experiences for users were invented in the early 1990s, starting with the Virtual Fixtures system developed at the U.S. Air Force's Armstrong Laboratory in 1992. The first commercial augmented reality experiences were used largely in the entertainment and gaming businesses, but now other industries are also getting interested about AR's possibilities for example in knowledge sharing, educating, managing the information flood and organizing distant meetings. Augmented reality is also transforming the world of education, where content may be accessed by scanning or viewing an image with a mobile device. Another example is an AR helmet for construction workers which display information about the construction sites.

## Development

The implementation of Augmented Reality in consumer products requires considering the design of the applications and the related constraints of the technology platform. Since AR system rely heavily on the immersion of the user and the interaction between the user and the system, design can facilitate the adoption of virtuality. For most Augmented Reality systems, a similar design guideline can be followed. The following lists some considerations for designing Augmented Reality applications:

### 1. Environmental/Context Design

Context Design focuses on the end-user's physical surrounding, spatial space, and accessibility that may play a role when using the AR system. Designers should be aware of the possible physical scenarios the end-user may be in such as:

1.Public, in which the users uses their whole body to interact with the software
2.Personal, in which the user uses a smartphone in a public space
3.Intimate, in which the user is sitting with a desktop and is not really in movement
4.Private, in which the user has on a wearable.

By evaluating each physical scenario, potential safety hazard can be avoided and changes can be made to greater improve the end-user's immersion. UX designers will have to define user journeys for the relevant physical scenarios and define how the interface will react to each.

Especially in AR systems, it is vital to also consider the spatial space and the surrounding elements that change the effectiveness of the AR technology. Environmental elements such as lighting, and sound can prevent the sensor of AR devices from detecting necessary data and ruin the immersion of the end-user.

Another aspect of context design involves the design of the system's functionality and its ability to accommodate for user preferences. While accessibility tools are common in basic application design, some consideration should be made when designing time-limited prompts (to prevent unintentional operations), audio cues and overall engagement time. It is important to note that in some situations, the application's functionality may hinder the user's ability. For example, applications that is used for driving should reduce the amount of user interaction and user audio cues instead.

### 2.Interaction Design

Interaction design in augmented reality technology centers on the user's engagement with the end product to improve the overall user experience and enjoyment. The purpose of Interaction Design is to avoid alienating or confusing the user by organising the information presented. Since user interaction relies on the user's input, designers must make system controls easier to understand and accessible. A common technique to improve usability for augmented reality applications is by discovering the frequently accessed areas in the device's touch display and design the application to match those areas of control. It is also important to structure the user journey maps and the flow of information presented which reduce the system's overall cognitive load and greatly improves the learning curve of the application.

In interaction design, it is important for developers to utilize augmented reality technology that complement the system's function or purpose. For instance, the utilization of exciting AR filters and the design of the unique sharing platform in Snapchat enables users to better the user's social interactions. In other applications that require users to understand the focus and intent, designers can employ a reticle or raycast from the device . Moreover, augmented reality developers may find it appropriate to have digital elements scale or react to the direction of the camera and the context of objects that can are detected.

The most exciting factor of augmented reality technology is the ability to utilize the introduction of 3D space. This means that a user can potentially access multiple copies of 2D interfaces within a single AR application. AR applications are collaborative, a user can also connect to another's device and view or manipulate virtual objects in the other person's context. For example, the application Vuforia Chalk.

## 3.Visual Design

In general, visual design is the appearance of the developing application that engages the user. To improve the graphic interface elements and user interaction, developers may use visual cues to inform user what elements of UI are designed to interact with and how to interact with them. Since navigating in AR application may appear difficult and seem frustrating, visual cues design can make interactions seem more natural.

In some augmented reality applications that uses a 2-D device as an interactive surface, the 2-D control environment does not translate well in 3-D space making users hesitant to explore their surroundings. To solve this issue, designers should apply visual cues to assist and encourage users to explore their surroundings.

It is important to note the two main objects in AR when developing VR applications: 3D volumetric objects that are manipulatable and realistically interact with light and shadow; and animated media imagery such as images and videos which are mostly traditional 2D media rendered in a new context for augmented reality.

# Leader's Talk

Facebook CEO Mark Zuckerberg admits that his Chinese still needs work, but that didn't stop the 31-year-old tech mogul from delivering his first speech in Mandarin on Saturday.Speaking at Tsinghua University in Beijing, Zuckerberg's 22-minute speech centered on three themes: believing in your mission, caring more deeply than anyone else and looking ahead.He told students that before they start anything, they should not only ask how they're going to do it, but why.

BELIEVE IN YOUR MISSION: Starting Facebook in 2004, Zuckerberg said he created the service because he wanted to solve a problem not because he wanted to build a business. At the time, there were ways to find books, movies and other material on the Internet but it was difficult to connect with people online. The social media site has gone through a flurry of changes since that time, including the creation of News Feed, a feature that some users did not like at first. Despite users who threatened to quit the service, Facebook didn't get rid of News Feed because the company knew it was a vital part of its mission. "We care about what people think. But we also know that connecting people is important. Most companies would be afraid of losing so many people, so they would take the easy path and give in," he said.

CARE MORE DEEPLY: Zuckerberg would spend nights at Harvard eating pizza and talking about the future with his classmates, but he didn't think at the time that he would be the one to build a service that connected the world. "I was just a college student. I thought a big company like Microsoft or Google would build this. They had thousands of engineers and hundreds of millions of users. They should have built the social network for the world. Why didn't they?," he said. The short answer, Zuckerberg said, is that they just cared more. There were doubts that Facebook could expand beyond college students, make money and even be used on mobile devices, but now the site has more than 1.5 billion users and is raking in billions of advertising dollars.

LOOK AHEAD: Despite Facebook's success, the social network's work to connect the world isn't done. The company launched Internet.org in 2013, an initiative to expand basic Internet service to developing countries. He told Facebook's board of directors then that he thought they should spend billions of dollars on this effort. "They asked me: how will this make money? I told them I don't know how. But I do know that connecting people is our mission and it is important. We must always look ahead and even if we don't know the whole plan now, if we help people, then in the future we will benefit too," he said.

This isn't the first time that Zuckerberg has showcased his language skills. He's conversed with President Xi Jinping of China entirely in Mandarin, has spoken the language in a Q&A session and even wished people a Happy Lunar New Year in Chinese.

Zuckerberg first started learning the language because his wife's family converses in Chinese.

With 1.4 billion people in China, Facebook is still trying to woo the country's officials as it attempts to expand the number of people who use the service.The problem though is that China started blocking Facebook and Twitter in 2009, after deadly riots in Xinjiang, a western region in the country.

# MANJUSHA

India is the land of arts and crafts. Almost every region has its own traditional form of art that includes drawings, paintings, embroideries, carvings, saris and more. We're really blessed to be born in a country with so much diversity in this space. Sadly, however, some of these art forms are on the verge of extinction.Let's take a look at the most beautiful of them which need to be saved right away!

## MANJUSHA:

Manjusha is believed to be the only art form in India that is displayed in series, each representing a story within it. This art form originated in Anga Pradesh (modern day Bihar). Back then, they made products only to be used in Bishahari festival, a festival dedicated to the snake god that took place in the district Bhagalpur. This art flourished heartily during the British rule in India. However, it started fading away in the middle of the 20th century. Fortunately, the Bihar government is making an effort to revive this craft and patent it as Bhagalpur folk art.

-P.Satya Sai(16A85A0507)

# FUN CORNER

## FUNRIDDLES

1: What is at the end of rainbow?
2: What do the numbers 11, 69, and 88 all have in common?
3: How can you throw a ball as hard as you can, to only have it come back to you, even if it doesn't bounce off anything?
4: My name is Ruger, I live on a farm. There are four other dogs on the farm with me. Their names are Snowy, Flash, Speedy and Brownie. What do you think the fifth dog's name is?
5: I am an odd number. Take away one letter and I become even. What number am I? 6: What word looks the same backwards and upside down?
7: A boy fell off a 30 meter ladder but did not get hurt. Why not? 8: What never asks questions but is often answered?
9: What belongs to you but other people use it more than you?
10: I have a large money box, 48 centimetres square and 42 centimetres tall. Roughly how many coins can I place in my empty money box?
