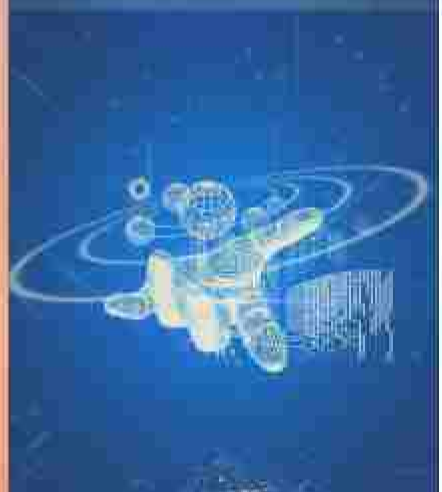
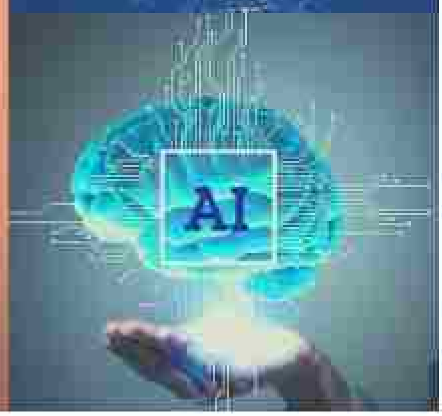
THE FUTURE IS HERE





python programming language:

Before going to the topic,i have few questions to ask...?

1.What is python programming language...?

2.Why one should learn python programming language..?

3.Why python is very easy and beginner friendly....?

Hope at the end of the artice you may get the answer for the questions.

what is python..?

Python is a programming language which is easy and very user friendly while learning,especially for a beginner.Let's go to find more about python. In 2008, we saw the release of Python 3.0, the latest major version of the language

History of python programming language:

Python was conceived in the late 1980s by Guido van Rossum at Centrum Wiskunde & Informatica (CWI) in the Netherlands as a suc cessor to the ABC programming language, which was in spired by SETL,capable of exception handling and interfacing with the Amoeba operating system. Its implementation began in December 1989.Van Rossum shouldered sole responsibility for the project, as the lead developer, until 12 July 2018, when he announced his "permanent vacation" from his responsibilities as Python's "benevolent dictator for life", community bestowed upon him to reflect his long-term commit ment as the project's chief decision-maker.

In January 2019, active Python core developers elected a five-member Steering Council to lead the project.

How did Python get its name?

Guido van Rossum wanted to give his programming language a name that was unique, mysterious and short, and what better than naming it Python after Monty Python's Flying Circus.

Features of python:

1.simple:

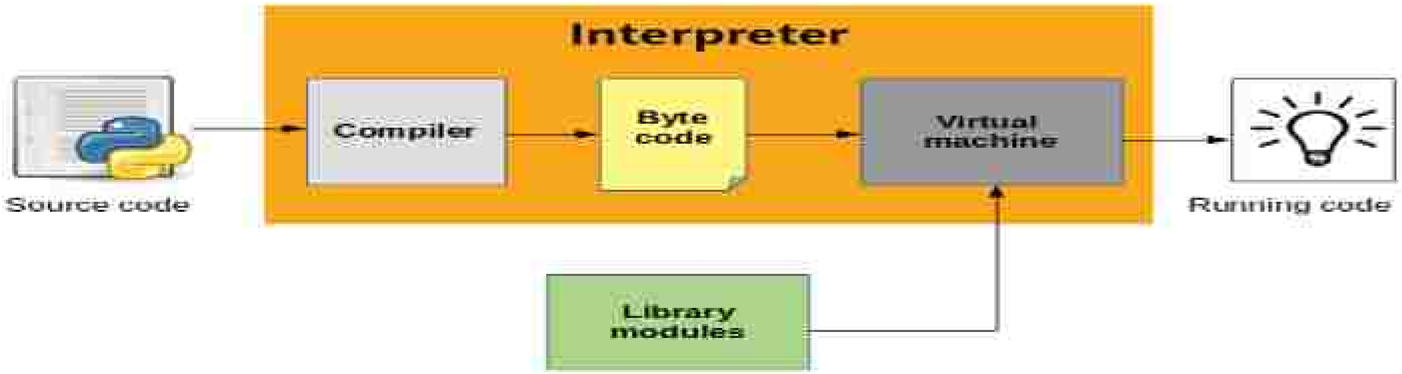
python is a simple programming language. When we read a python program,we feel like reading English sentences.it means more clarity and less stress on understanding the syntax of the language.Hence,developing and learning programs will become easy.

2.open source:

There is no need to pay for python software.Python can be freely downloaded from *www.python.org* website.Its source coe can be read, modified and can be used in programs as desired by the programmers.

3.Platform independent:

When a python program is compiled using a python compiler,it gen erates byte code.Python's byte code represents a fixed set of instructions



that run on all operating sysytems and hardware.Using a Python virtual machine(PVM),anybody can run these byte code instructions on any computer system.Hence,python programs are not dependent on any specific operating system.We can use Python on almost all operating systems like Unix,Linux,Windows and other operating systems. this makes python an ideal programming language for any network or internet.

4.portable

when a program yields the same result on any computer in the world, then it is called as portable program.Python program will give same result since they are platform independent.

5.Procedure and object oriented:

Python is a procedure oriented as well as object oriented programming language.In object oriented programming the program uses classes and objects.In object oriented programming or oops ,we have some features they are

1.classes and objectsc
2.Encapsulation
3.Abstraction
4.Inheritance
5.Polymophism

Essential Advantages of Python:

1. Availability of support
2. Large global community
3. In-demand skill in the job market
4. Free learning resources

5. Extensive libraries
6. Powerful frameworks
7. Works on any computer
8. Versatility
9. Productivity and workflow speed
10. Fast prototype development

Benifits of python:

Python is highly used in

1. Machine learning and artifical intelligence
2. Deep learning
3. Data science
4. Exploration and Data Analysis
5. Statistics

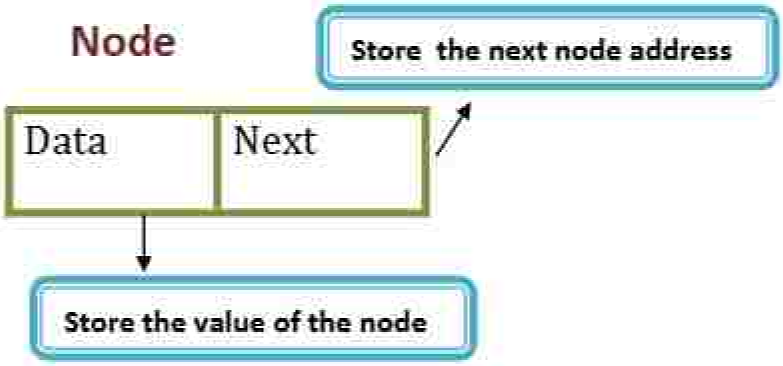
SINGLE LINKED LIST (PICTORIAL EXPLANATION)

Single linked list : It is a sequence of elements in which every element as a link to its next element in single linked list every individual element is called as node.

i) Node contains two fields →data field and address field .



```
Struct node
{
   Int data;
   Struct node *next;
}
Struct node *head;
```

Operations on singe linked lists:

Insertion :

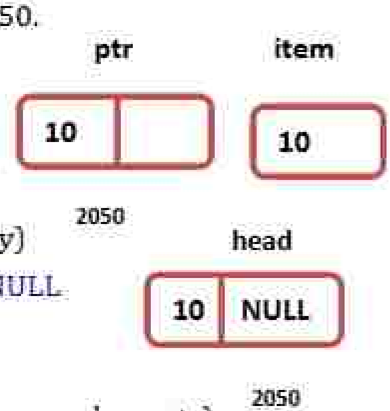
Insert at beginning code :

```
1  void insertbegin()
2  {
3    struct node *ptr;
4    int item;
5    ptr=(struct node *)malloc(
     sizeof(struct node *));
6    printf("\nEnter a value");
7    scanf("%d",&item);
8    ptr->data=item;
9    if(head==NULL)
10  {
11    ptr->next=NULL;
12    head=ptr;
13    printf("\nNode is inserted");
14  }
15  else
16  {
17     ptr->next=head;
18     head=ptr;
19   }
20 }
```

Tracing

Basically we are using structure concept in this, After the structure is defined.

From line 3 – 5 : A structure pointer variable has a dynamic memory named as ptr and an integer variable is item. Are empty. Consider ptr address is 2050.



From line 6 to 8 :
head is a name of the first node in list.

Case 1: head is NULL (List is empty)

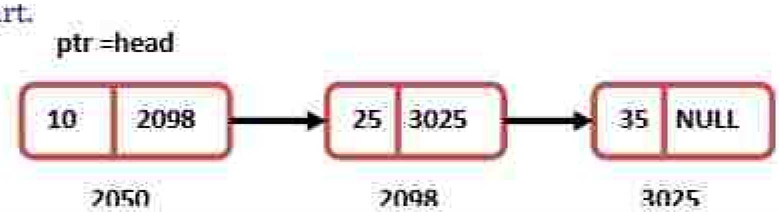
From line 11-13 : ptr->next =NULL
head =ptr;

head= 2050

Case 2: head is not NULL(List has some elements)

From line 17 -18 : ptr→next = head;
head=ptr;

consider a list contains some elements and we have to insert at start.



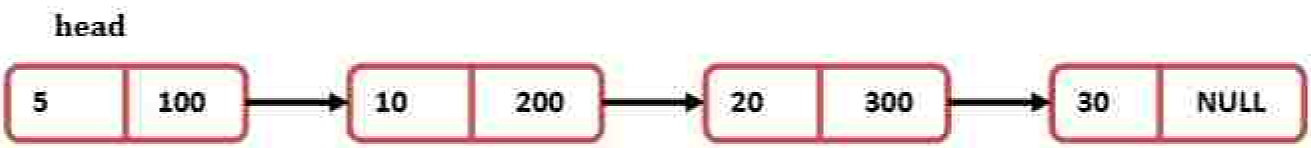
SINGLE LINKED LIST (PICTORIAL EXPLANATION)

Example: **Let us consider a list has some elements and we want to insert a new element 5 at start of the list.**

Before inserting:

After inserting:

ptr -> data =5



Insert at last code :

```
1  void insertlast()
2  {
3      struct node *ptr,*temp;
4      int item;
5      ptr = (struct node*)malloc(
       sizeof(struct node));
6      printf("\nEnter value\n");
7      scanf("%d",&item);
8      ptr->data = item;
9      if(head == NULL)
10     {
11         ptr -> next = NULL;
12         head = ptr;
13         printf("\nNode inserted");
14     }
15     else
16     {
17         temp = head;
18         while (temp -> next != NULL)
```

Tracing

From line 3- 14 : The code as like as begin insert but an extra pointer is defined is temp.

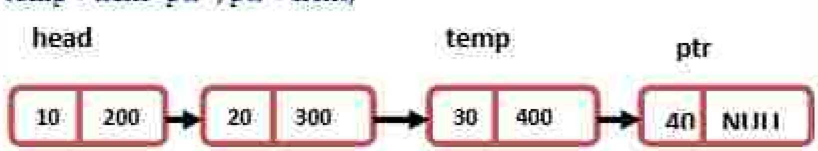
From line 15:

Consider a list of some elements :temp=head

From line 18 -21: Using while loop temp name is assigned to last node.

From line 22:

temp->next=ptr , ptr->next;

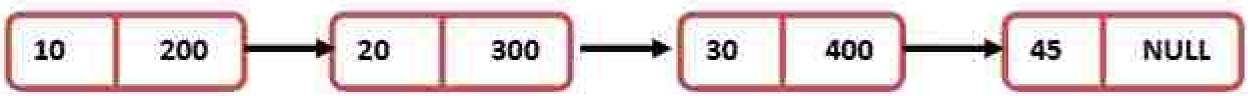


```
        {
              temp = temp -> next;
        }
        temp->next = ptr;
        ptr->next = NULL;
        printf("\nNode inserted");
    }
}
```

Example: **Let us consider a list has some elements and we want to insert a new element 45 at last of the list.**

Before inserting:

After inserting:



Insert at specified code :

```
1   void randominsert()
2   {
3         int i,loc,item;
4         struct node *ptr, *temp;
5         ptr = (struct node *) malloc (
           sizeof(struct node));
6         printf("\nEnter element value");
7         scanf("%d",&item);
8         ptr->data = item;
9         printf("\nEnter the location
          after which you want to insert ");
10        scanf("\n%d",&loc);
11        temp=head;
12        for(i=0;i<loc;i++)
13        {
14           temp = temp->next;
15           if(temp == NULL)
```

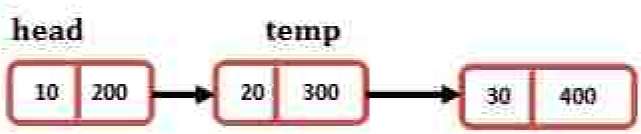
From line 3-8: The code as like as begin last but an extra integer is defined as loc.

From line 9-10 : It takes the location where node to be inserted.

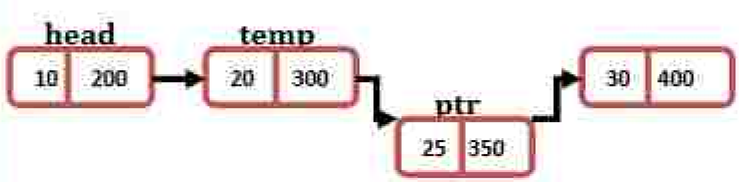
From line 10: temp=head

temp=head

Using for loop we get to required location. if **loc=2**



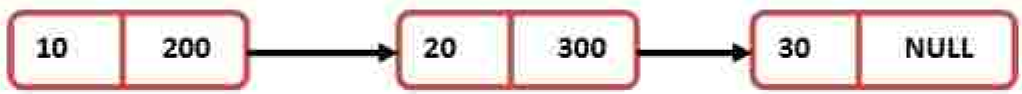
ptr->next=temp->next, temp->next=ptr;



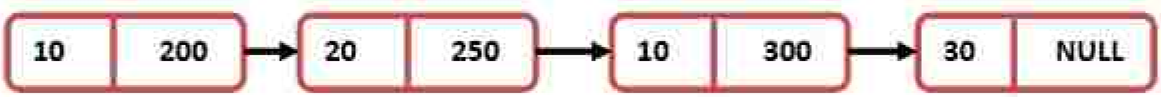
```
        {
           printf("\ncan't insert\n");
          return;
        }
        ptr ->next = temp ->next;
       temp ->next = ptr;
       printf("\nNode inserted");
    }
}
```

Example: **Let us consider a list has some elements and we want to insert a new element 45 at 2nd location of the list.**

Before inserting



After inserting:



Deletion:

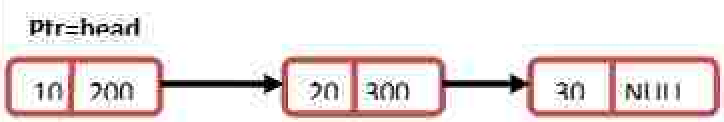
Delete at begin code :

```
1   void begin_delete()
2   {
3       struct node *ptr;
4       if(head == NULL)
5       {
6           printf("\nList is empty\n");
7       }
8       else
9       {
10          ptr = head;
11          head = ptr->next;
12          free(ptr);
13          printf("\nNode deleted from
14          the begining ...\n");
15      }
16  }
```

From line 3: Structure variable is declared as ptr.

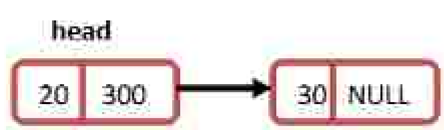
From line 4-7:Checking if the list is empty

From line 10 -12:i)ptr=head.



head=ptr->next.

Free(ptr)

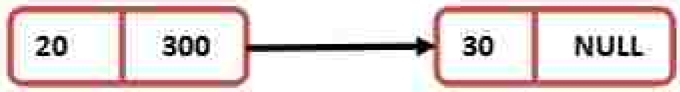


SINGLE LINKED LIST (PICTORIAL EXPLANATION)

Example: **Let us consider a list has some elements and we want to delete an element from the list.**

Before deleting:

After deleting:



Delete at last code :

```
1   void last_delete()
2   {
3     struct node *ptr,*ptr1;
4     if(head == NULL)
5     {
6       printf("\nlist is empty");
7     }
8     else if(head -> next == NULL)
9     {
10      head = NULL;
11      free(head);
12      printf("\nOnly node of the list
13     deleted ...\n");
14    }
15    else
16    {
17      ptr = head;
18      while(ptr->next != NULL)
19      {
20        ptr1 = ptr;
21        ptr = ptr ->next;
22      }
23      ptr1->next = NULL;
24      free(ptr);
25      printf("\nDeleted Node
26     from the last ...\n");
27    }
28  }
```

From line 3-7: The code is as like as delete begin

From lines 8-14:Checking if the list contains only one node

If it is true head is freed.

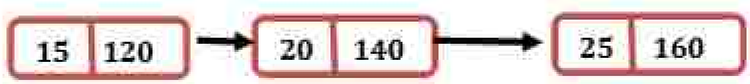
If not

From line15-26:ptr=head

Using while loop we get to last node named as ptr andt the node before this node named as ptr1.

ptr1->next=NULL; free(ptr)

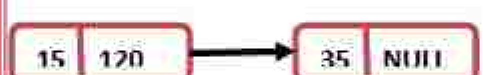
head



Example:

Before deleting:

After deleting:

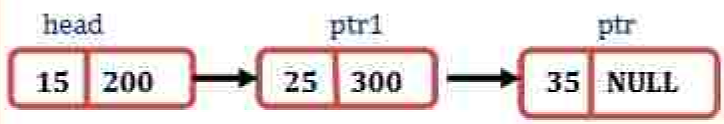


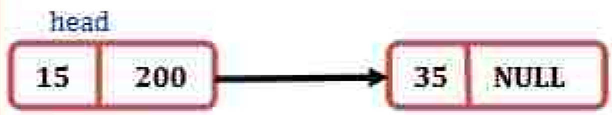
SINGLE LINKED LIST (PICTORIAL EXPLANATION)

Delete at specified code :

```
1   void random_delete()
2   {
3     struct node *ptr,*ptr1;
4     int loc,i;
5     printf("\n Enter the location \n");
6     scanf("%d",&loc);
7     ptr=head;
8     for(i=0;i<loc;i++)
9     {
10      ptr1 = ptr;
11      ptr = ptr->next;
12     }
13     ptr1 ->next = ptr ->next;
14     free(ptr);
15     printf("\nDeleted node %d ",loc+1);
16  }
17
18
```

From line 3-5:Two structure variable are declared as ptr, ptr1 and two integer variables are loc,I.
From lines 7-12:we get to required location using for loop and that node is named as ptr and the node before this named as ptr1. Ptr1→next=ptr→next and free (ptr)

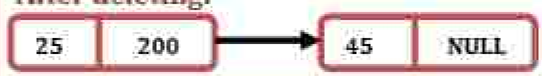




Example:

Before deleting:

After deleting:



Display code :

```
1   void display()
2   {
3     struct node *ptr;
4     ptr = head;
5     if(ptr == NULL)
6     {
7       printf("Nothing to print");
8     }
9     else
10    {
11      while (ptr!=NULL)
12      {
13        printf("%d==>",ptr->data);
14        ptr = ptr -> next;
15      }
16    }
17  }
```

From line 3-8: the code is as like as above functions.
From line 11-16
Using while loop we get through all node and print them.

Example

Output:

15==>
25==>
35==>

ROVER MISSION

USING JAVA TECHNOLOGY

HOW IT IS STARTED?

Java, the software developed by Sun Microsystems in the mid-1990s as a universal operating system for Internet applications, gave NASA a low-cost and easy-to-use option for running Spirit, the robotic rover that rolled onto the planet's surface on Thursday in search of signs of water and life.

A return to the surface of Mars has long been an objective of NASA mission planners. The ongoing Mars Rover and Sample Return(MRSR) mission study represents the latest stage in that interest. As part of NASA's preparation for a possible MRSR mission.

Man who is a good explorer by nature is trying to invade his next planet, the Mars, with the help of JAVA enabled rovers. Both JAVA and rovers are wonders created by man

MARS EXPLORATION ROVERS MISSION

TWIN ROBOT GEOLOGIES SEARCH FOR PAST RUNNING WATER

LAUNCHED ON

June 10 & July 7

LANDED

January 3 & 24, 2004

DURATION

90+days

MISSION CENTER

Jet propulsion laboratory

ABOUT ROVER MISSION

Java technology today is good for general purpose computing and GUIs, but it was not ready for use with control systems like the software on the Rover. The Golden Gate project seeks to use RTSJ (Real Time Specification for JAVA) to develop a system of control software that can be used on a Rover.

The places where NASA scientists have used Java for this mission is all on the groundside right now.

They have created this collaborative command and control system called Maestro, which does this combination of data visualization, collaboration, command and control.

Java RTS enables developers of real-time applications to take full advantage of the Java language ecosystem while maintaining the predictability of current real-time development platforms. Java RTS also brings the world of real-time programming to developers currently using Java technology to create applications that reach into the physical world.

MARS ROVER

Golden Gate project is being worked on which will create code that would replace the proprietary APIs and real-time operating system code (Wind River) in future missions. Java 3D and Java Advanced Imaging technology are also key to the software JPL (Jet Propulsion Laboratory) is using to render and interpret real time images captured by the Rover.JAVA, due to its unique features like, platform independency, rich set of API libraries such as 3-D modeling APIs, Advanced Imaging APIs and its Mission Data System to control physical systems fuelled the Mars exploring rover mission. Greater commonality is being created between the flight system on the Rover and the ground system -- all essentially using Real-Time Specification for Java (RTSJ), and a more seamless development environment for the entire system. Java language pioneer James Gosling calls the ground-side control system that sent signals to the Mars Rover," the coolest Java app ever".Mars Exploration Rovers Mission

CONCLUSION

We all know how JAVA emerged from the hands of Gosling's team who were trying to program an application which could work efficiently on electronic devices. It was a success and soon java spread over the world due to its unique feature, platform independency to be used in web applications. Now JAVA and its rich set of API are even helping us drive to our next planet MARS.Now we have two rovers on mars each exploring the red planet.

KOHINOOR

We all well aware of this name. Kohinoor, is one of the *largest cut diamonds* in the world, weighing 105.6 carats (21.12 g).And now It is part of the British Crown Jewels.

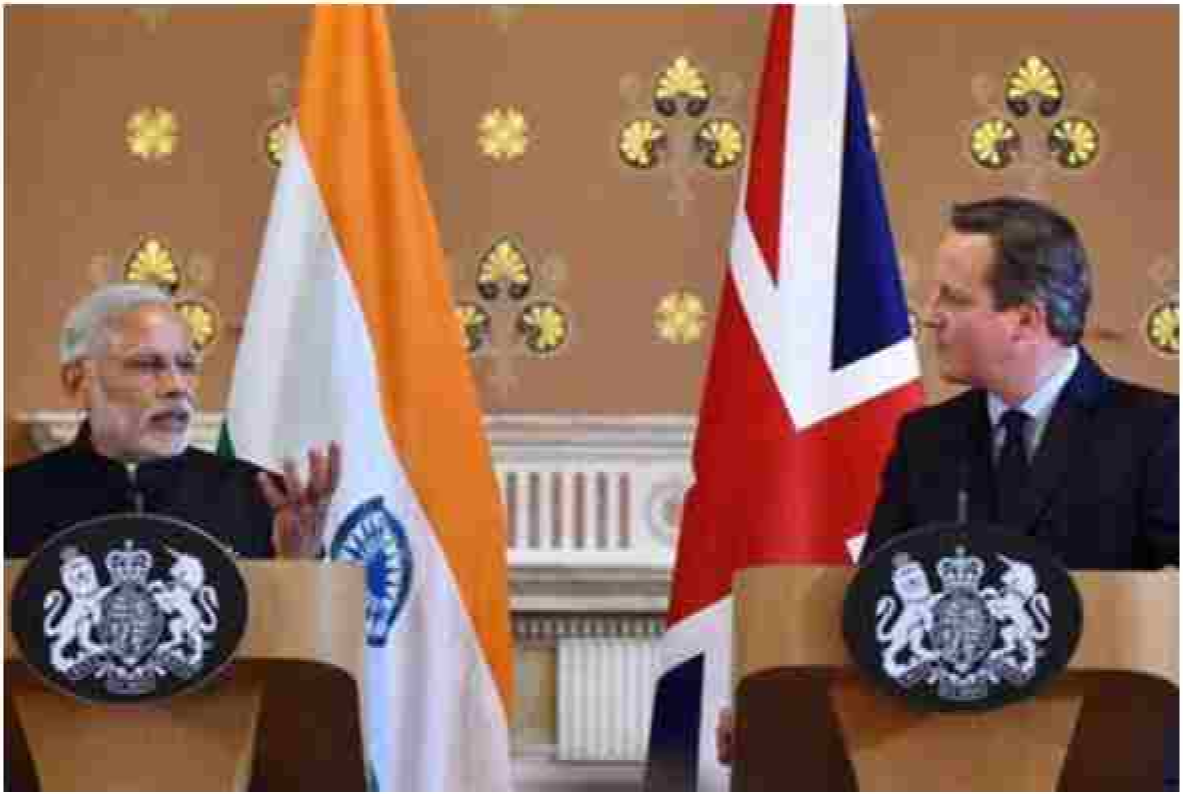
Origin

The diamond may have been mined from Kollur Mine,a series of 4-metre (13 ft) deep gravel-clay pits on the south bank of the Krishna River in the Golconda (present-day Andhra Pradesh), India. It is impossible to know exactly when or where it was found, and many unverifiable theories exist as to its original owner.
During the period of the Kakatiya dynasty, there is no record of its original weight – but the earliest well-attested weight is 186 old carats (191 metric carats or 38.2 g). It was later acquired by Afghan Delhi Sultan Alauddin Khalji.
The diamond was also part of the ***Mughal Peacock Throne.***

It changed hands between various factions in south and west Asia, until being ceded to Queen Victoria after the British annexation of the Punjab in 1849, during the reign of eleven-year-old emperor Maharaja Duleep Singh under the shadow influence of the British ally Gulab Singh the 1st Maharaja of Jammu and Kashmir, who had previously been in possession of the stone.

Originally, the stone was of a similar cut to other Mughal-era diamonds, like the Darya-i-Noor, which are now in the Iranian Crown Jewels. In 1851, it went on display at the Great Exhibition in London, but the lacklustre cut failed to impress viewers .Prince Albert, husband of Queen Victoria, ordered it to be re-cut as an oval brilliant by Coster Diamonds. By modern standards, the culet (point at the bottom of a gemstone) is unusually broad, giving the impression of a black hole when the stone is viewed head-on; it is nevertheless regarded by gemologists as "full of life".

Ownership dispute:



The Government of India, believing the gem was theirs, first demanded the return of the Koh-i-Noor as soon as independence was granted in 1947. A second request followed in 1953, the year of the coronation of Queen Elizabeth II. Each time, the British Government rejected the claims, saying that ownership was non-negotiable.

In 2000, several members of the Indian Parliament signed a letter calling for the diamond to be given back to India, claiming it was taken illegally.

British officials said that a variety of claims meant it was impossible to establish the diamond's original owner,and that it had been part of Britain's heritage for more than 150 years.

In July 2010, while visiting India, David Cameron, the Prime Minister of the United Kingdom, said of returning the diamond

“If you say yes to one you suddenly find the British Museum would be empty. I am afraid to say, it is going to have to stay put”.On a subsequent visit in February 2013, he said, “They’re not having that back”.

In April 2016, the Indian Culture Ministry stated it would make “all possible efforts” to arrange the return of the Koh-i-Noor to India. It was despite the Indian Government earlier conceding that the diamond was a gift.

The Solicitor General of India had made the announcement before the Supreme Court of India due to public interest litigation by a campaign group.He said “It was given voluntarily by Ranjit Singh to the British as compensation for help in the Sikh Wars. The Koh-i-Noor is not a stolen object”.

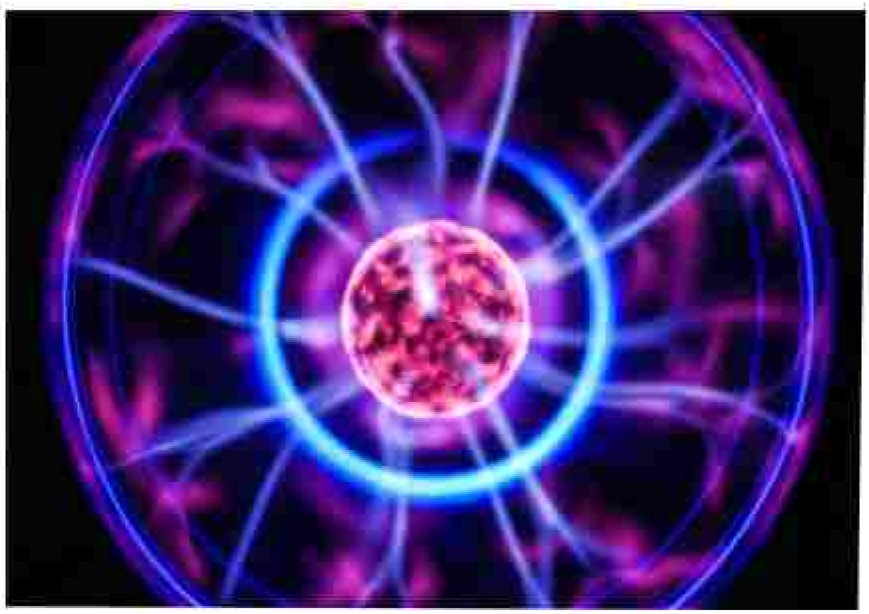
Plasma propulsion engine

A plasma propulsion engine is a type of electric propulsion that generates thrust from a quasi-neutral plasma. This is in contrast with ion thruster engines, which generate thrust through extracting an ion current from the plasma source, which is then accelerated to high velocities using grids/anodes.

These exist in many forms (see electric propulsion). However, in the scientific literature, the term “plasma thruster” sometimes encompasses thrusters usually designated as “ion engines”.



This type of thruster has a number of advantages. The lack of high voltage gridsof anodes removes a possible limiting element as a result of grid ion erosion. The plasma exhaust is **‘quasi-neutral’,** which means that positive ions and electrons exist in equal number, which allows simple ion-electron recombination in the exhaust to neutralize the exhaust plume, removing the need for an electron gun (hollow cathode).

Such a thruster often generates the source plasma using radio frequency or microwave energy, using an external antenna.

This fact, combined with the absence of hollow cathodes (which are sensitive to all but noble gases), allows the possibility of using this thruster on a variety of propellants, from argon to carbon dioxide air mixtures.

History of Plasma engines:

Some plasma engines have seen active flight time and use on missions. In 2011, NASA partnered with Busek to launch the first hall effect thruster aboard the Tacsat-2 satellite. The thruster was the satellite's main propulsion system. The company launched another hall effect thruster that year. In 2020, research on a plasma jet was published by Wuhan University.

The thrust estimates published in that work, however, were subsequently shown to be almost nine times theoretically possible levels even if 100% of the input microwave power were converted to thrust.

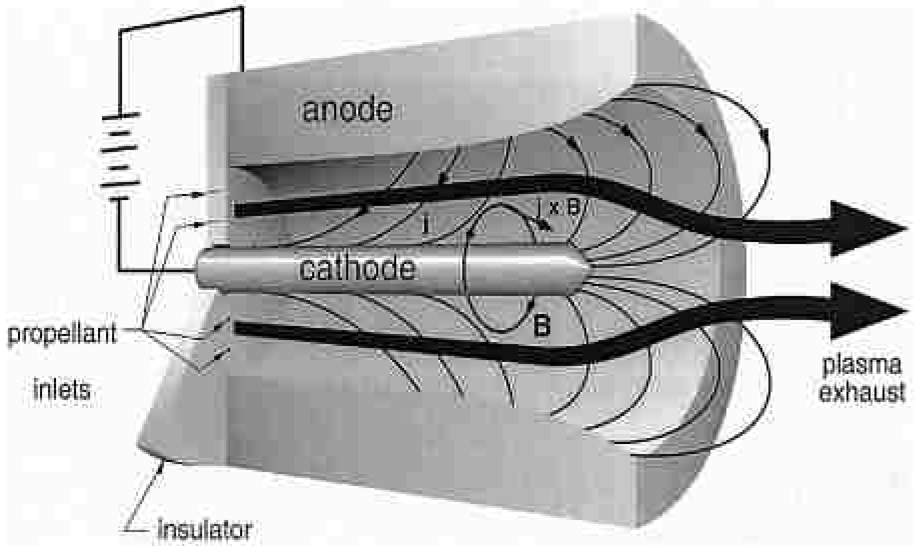
Engine types:

Helicon plasma thrusters:

Helicon plasma thrusters use low-frequency electromagnetic waves (Helicon waves) that exist inside plasma when exposed to a static magnetic field. An RF antenna that wraps around a gas chamber creates waves and excites the gas, creating plasma.

The plasma is expelled at high velocity to produce thrust via acceleration strategies that require various combinations of electric and magnetic fields of ideal topology. They belong to the category of electrodeless thrusters. These thrusters support multiple propellants, making them useful for longer missions. They can be made out of simple materials including a glass soda bottle.

Magnetoplasmadynamic thrusters:



Magnetoplasmadynamic thrusters (MPD) use the Lorentz force (a force resulting from the interaction between a magnetic field and an electric current) to generate thrust.
The electric charge flowing through the plasma in the presence of a magnetic field causes the plasma to accelerate. The Lorentz force is also crucial to the operation of most pulsed plasma thrusters.

Pulsed inductive thrusters:

Pulsed inductive thrusters (PIT) also use the Lorentz force to generate thrust, but they do not use electrodes, solving the erosion problem. Ionization and electric currents in the plasma are induced by a rapidly varying magnetic field.

Electrode less plasma thrusters:

Electrodeless plasma thrusters use the ponderomotive force which acts on any plasma or charged particle when under the influence of a strong electromagnetic energy density gradient to accelerate plasma electrons and ions in the same direction, thereby operating without a neutralizer.

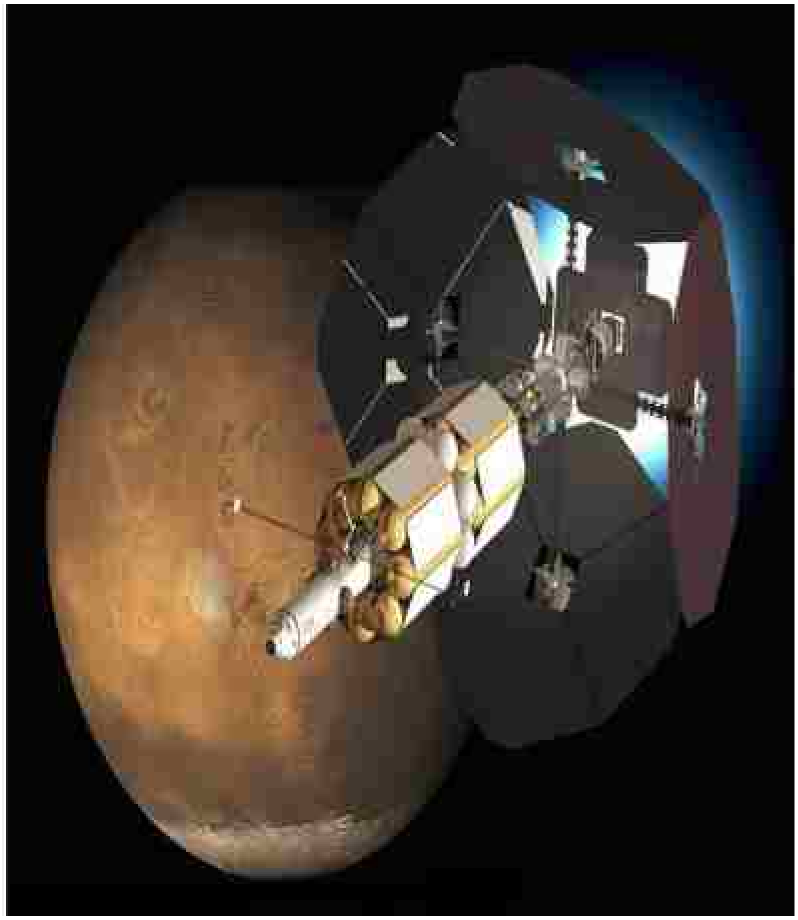
VASIMR:

VASIMR, short for Variable Specific Impulse Magnetoplasma Rocket, uses radiowaves to ionize a propellant into a plasma.
A magnetic field then accelerates the plasma out of the engine,

generating thrust. A 200-megawatt VASIMR engine could reduce the time to travel from Earth to Jupiter or Saturn from six years to fourteen months, and from Earth to Mars from **6 months to 39 days.**

Advantagaes:

The VASIMR thruster can be throttled for an impulse greater than 12000 s, and hall thrusters have attained ~2000 s.



This is improved over the bipropellant fuels of conventional chemical rockets which feature specific impulses ~450 s.

With high impulse, plasma thrusters are capable of reaching relatively high speed over extended periods of acceleration.

Ex- astronaut Franklin Plasma engines have a much higher specific impulse (Isp) value than most other types of rocket Chang-Diaz claims the VASIMR thruster could send a payload to Mars in as little as 39 days, while reaching a maximum velocity of 34 miles per second (55 km/s).

ATHLETICS

IN OLYMPICS

Javelins were often used as an effective hunting weapon, the strap adding enough power to take down large game. Javelins were also used in the Ancient Olympics and other Panhellenic games. They were hurled in a certain direction and whoever hurled it the farthest, as long as it hit tip-first, won that game.

JAVELIN THROW

ATHLETICS

The javelin throw is a **track and field** event where the **javelin**, a **spear** about 2.5 m (8 ft 2 in) in length, is thrown. The javelin thrower gains **momentum** by running within a predetermined area. Javelin throwing is an event of both the men's **decathlon** and the women's **heptathlon**.

TECHNIQUE AND TRAINING

Unlike other throwing events, javelin allows the competitor to build speed over a considerable distance. In addition, the core and upper body strength is necessary to deliver the implement, javelin throwers benefit from the agility and athleticism typically associated with running and jumping events. Thus, the athletes share more physical characteristics with sprinters than with others, although they still need the skill of heavier throwing athletes.

Traditional free-weight training is often used by javelin throwers. Metal-rod exercises and resistance band exercises can be used to train a similar action to the javelin throw to increase power and intensity. Without proper strength and flexibility, throwers can become extremely injury prone, especially in the shoulder and elbow. Core stability can help in the transference of physical power and force from the ground through the body to the javelin. Stretching and sprint training are used

The distance a javelin is thrown is affected by factors such as wind speed and direction and the aerodynamics of the javelin. But the two most important and controllable factors are javelin release speed and release angle

to enhance the speed of the athlete at the point of release, and subsequently, the speed of the javelin. At release, a javelin can reach speeds approaching 113 km/h (70 mph).

RECORDS

men's world record is held by **Jan Železný** at 98.48 m (1996); **Barbora Špotáková** holds the women's world record at 72.28 m (2008).

JAN ZELEZNY

BARBORA SPOTAKOVA

Javelin thrower Neeraj Chopra, who made history on August 7, 2021 by winning India's first-ever gold medal in athletics at the Tokyo Olympics

NEERAJ CHOPRA

BENEFITS OF JAVELIN THROW

The greatest advantage of throwing heavy implements is that they increase the feeling of the movement in the circle. The increased load forces the thrower to slow down, making technical changes easier to grasp.

The glenohumeral joint and the humeroulnar joint are extended and flexed at an angle equal to 90 degrees. This helps the player build speed and generate the momentum required for the throw. Major muscles used are the soleus, gastrocnemius, hamstrings, quadriceps, and gluteus maximus.

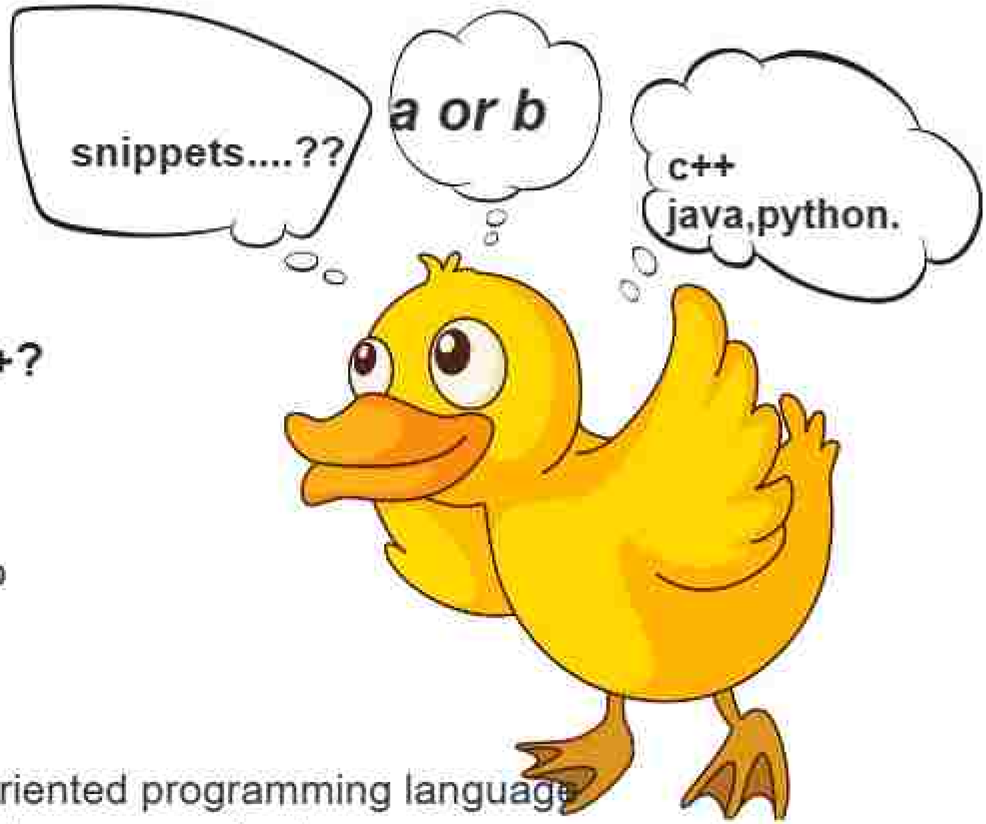
snippets...??



1. Who invented C++?

a) Dennis Ritchie
b) Ken Thompson
c) Brian Kernighan
d) Bjarne Stroustrup

2. What is C++?

a) C++ is an object oriented programming language
b) C++ is a procedural programming language
c) C++ supports both procedural and object oriented programming language
d) C++ is a functional programming language

3. Which of the following is used for comments in C++?

a) /* comment */
b) // comment */
c) // comment
d) both // comment or /* comment */

4. Which of the following user-defined header file extension used in c++?

a) hg
b) cpp
c) h
d) hf

5. What happens if the following program is executed in C and C++?

```
#include <stdio.h>
void func(void)
{
        printf("Hello");
}
void main(){
        func();
        func(2);
}
```

a) Outputs Hello twice in both C and C++
b) Error in C and successful execution in C++
c) Error in C++ and successful execution in C
d) Error in both C and C+

6. What is the value of p in the following C++ code snippet?

```
#include <iostream>
using namespace std;
int main()
{
    int p;
    bool a = true;
    bool b = false;
    int x = 10;
    int y = 5;
    p = ((x | y) + (a + b));
    cout << p;
    return 0;
}
```

a) 12
b) 0
c) 2
d)16

7. What will be the output of the following C++ code?

```
#include <iostream>
using namespace std;
int main()
{
    char c = 74;
    cout << c;
    return 0;

}
```

a) I
b) J
c) A
d)N
